

AI AGENT-BASED EXPERT TRAINING & COACHING PLATFORM

Solution wireframes and process flow

Indicative user interface mock-ups and the end-to-end technical process flow for the proposed Leadership Intelligence Platform. Submitted in support of the Malaysia Digital Status application, Section B: Proposed Activities.

WIREFRAMES 01-06

PROCESS FLOW

INDICATIVE – PRE-LAUNCH

End-to-end learner flow

Each stage of the journey is owned by a specialised agent. The orchestrator sequences the stages and carries learner state between them, so the loop compounds rather than restarting.

Learner dashboard

The learner's home. Shows current competency standing, the generated development pathway, and the next recommended action.

- 1 **Mastery score**
Maintained by the knowledge-tracing model, updated after every interaction.
- 2 **Competency profile**
Mapped to the Company's proprietary leadership frameworks, not a generic skills list.
- 3 **Recommended next action**
Selected by the planner agent from the learner's current gap profile.
- 4 **Persistent context**
The orchestrator carries prior sessions forward, so coaching never restarts cold.

Adaptive assessment

The assessor agent administers a branching diagnostic. Item difficulty and topic adjust in response to each answer, so the diagnostic converges on the learner's true level in fewer items than a fixed test.

- 1 **Branching logic**
The next item is chosen from the response to this one — the test length is not fixed.
- 2 **Free-text reasoning**
Captured for rubric scoring by the evaluator agent, not just the multiple-choice answer.
- 3 **Situational items**
Drawn from the curated knowledge base of real leadership scenarios.
- 4 **Live model update**
Each response updates the mastery estimate before the next item is served.

AI coaching conversation

The tutor agent handles live coaching on situations the learner brings to it. Every response is grounded by retrieval over the proprietary knowledge base before generation.

- Persistent memory**
The coach recalls prior sessions, goals and reflections across weeks.
- Pattern detection**
Behavioural analytics surface recurring patterns the learner has not named themselves.
- Grounded response**
Retrieval over the competency frameworks constrains the coaching to the Company's methodology.
- Writes back to the pathway**
The tutor can hand off to the planner to insert a rehearsal.
- Voice input**
Speech-to-text for spoken sessions.

Scenario simulation and role-play

The simulator agent plays a counterpart in a realistic scenario. The learner rehearses aloud; the evaluator scores the exchange against rubrics in real time.

- 1 Calibrated counterpart
The simulated stakeholder's difficulty is set from the learner's current mastery.
- 2 Spoken rehearsal
Speech-to-text in, text-to-speech out, so the practice matches the real setting.
- 3 Real-time rubric scoring
The evaluator scores the exchange as it happens, not afterwards.
- 4 In-session correction
Nudges are issued mid-scenario, which is where behaviour actually changes.

Enterprise administrator console

The organisational view. Aggregated, anonymised capability data across cohorts, supporting talent management and succession planning — the layer no individual coaching engagement can produce.

- 1 Aggregated and anonymised
Individual coaching content is never exposed to administrators.
- 2 Team competency mapping
Capability gaps visible by function, which is what drives succession decisions.
- 3 Longitudinal growth
Measured movement over time, not attendance or completion.
- 4 Benchmarking
Anonymised cross-client comparison — a data asset that compounds with platform usage.

End-to-end technical process flow

How a single learner interaction is processed. Named tools shown at each stage. Open-source and self-hosted components run on the Company's own infrastructure in the AWS Asia Pacific (Malaysia) Region.
